PSYCHIATRIC STATEMENT

Name of patient: Abraham Gable

Date of Birth: 1/1/85

Date of statement: 8/12/18

Abraham Gable has been in psychiatric treatment with me since January 2001. He has a history dating back to early childhood of significant impairments in social interaction and communication skills associated with stereotyped, bizarre and inappropriate behaviors and impulse dysregulation. He had been diagnosed with a variety of disorders and treated with numerous medications. At the time of his initial consultation with me, he was becoming increasingly agitated and had been experiencing an escalation of aggressive and ritualistic behaviors, rendering him unmanageable at home and in school. Neurologic evaluation ruled out any underlying neurologic condition. The nature and course of Abraham's past symptoms warranted a DSM-IV diagnosis of Pervasive Developmental Disorder NOS with psychotic exacerbations. Abraham has always functioned in the retarded range and Intellectual Disability is the secondary diagnosis.

Following his initial consultation, Abraham's medication regimen was completely revamped to take into account his worsening condition and revised diagnosis. Trials on antipsychotic and mood-stabilizing medications were either ineffective or caused serious adverse effects and he ultimately was hospitalized at New York-Presbyterian Hospital in May 2001, where a regimen of Risperdal and Celexa helped to stabilize him. Following his hospitalization, he continued seeing me on an outpatient basis and was maintained on Risperdal, Celexa and Cogentin. However, significant weight gain prompted a switch from Risperdal to Abilify many years ago. Abraham's weight has stabilized in recent years, but he remains at risk for metabolic syndrome. Metformin was prescribed by his primary care physician but it was discontinued. Abraham is still prone to rigid thinking, oppositional and aggressive behavior and explosive outbursts, which led to his current medication regimen, consisting of Abilify 30mg qd, Zoloft 50mg qhs, Tenex 1mg TID, Klonopin 0.5mg TID and Cogentin 1mg BID. This regimen has been in place for many years. Abraham has required a therapeutic group home setting because of his severe social, emotional, behavioral, communication and cognitive deficits. There have been rare ER visits and one or two in-patient experiences, but he has been relatively stable for an extended period of time.

Current mental status reveals an alert man who relates in an awkward and immature but friendly manner. Speech is idiosyncratic, perseverative and concrete with a paucity of thought content. There is no suicidal ideation. Judgment and insight are poor. There is no evidence of delusions or hallucinations. There are no abnormal movements, tics or rituals. Cognitive abilities are severely impaired.

David M. Brody, M.D.
